01

REPOREEL

Find the reel.
Then the repo.

Ask in plain words, get the exact Instagram reel that answers it, then the GitHub repo it was teasing. No "comment REPO", no DMs.

NO DMs NEEDED ✌

PYTHON / DUCKDB / FASTEMBED / REACT / TRANSFORMERS.JS / TESSERACT / GITHUB ACTIONS

02

THE PROBLEM: "COMMENT REPO AND I'LL DM YOU"

The link never comes

Repo reels gate the link behind a comment or a DM to farm engagement. Days later, still nothing.

Captions hide the name

4 in 5 of the 411 English repo reels indexed so far don't name the repo in a way that can be matched.

Reels vanish

You saw the perfect tool last week. Instagram has no search for "that repo that cleans your TV".

The response: ask the question, get the reel, get the repo, read it, use it.

03

ASK. REEL. REPO. READ. USE.

01 ASK

plain words "remove ads from my smart TV"

→

02 REEL

the exact reel, playing in the phone

→

03 REPO

the repo it was hiding, one tap

→

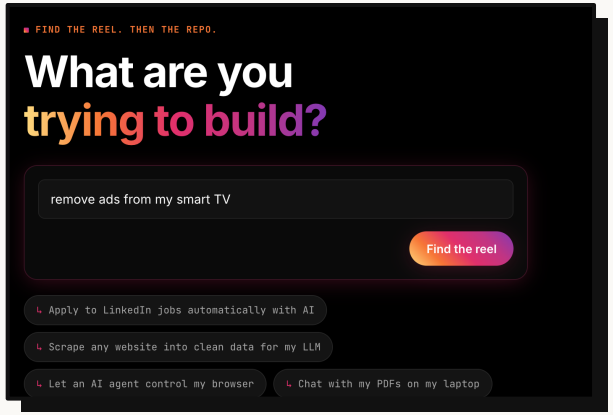

04 READ

README, stars, health, 7-day velocity

→

05 USE

git clone and go

Understands meaning

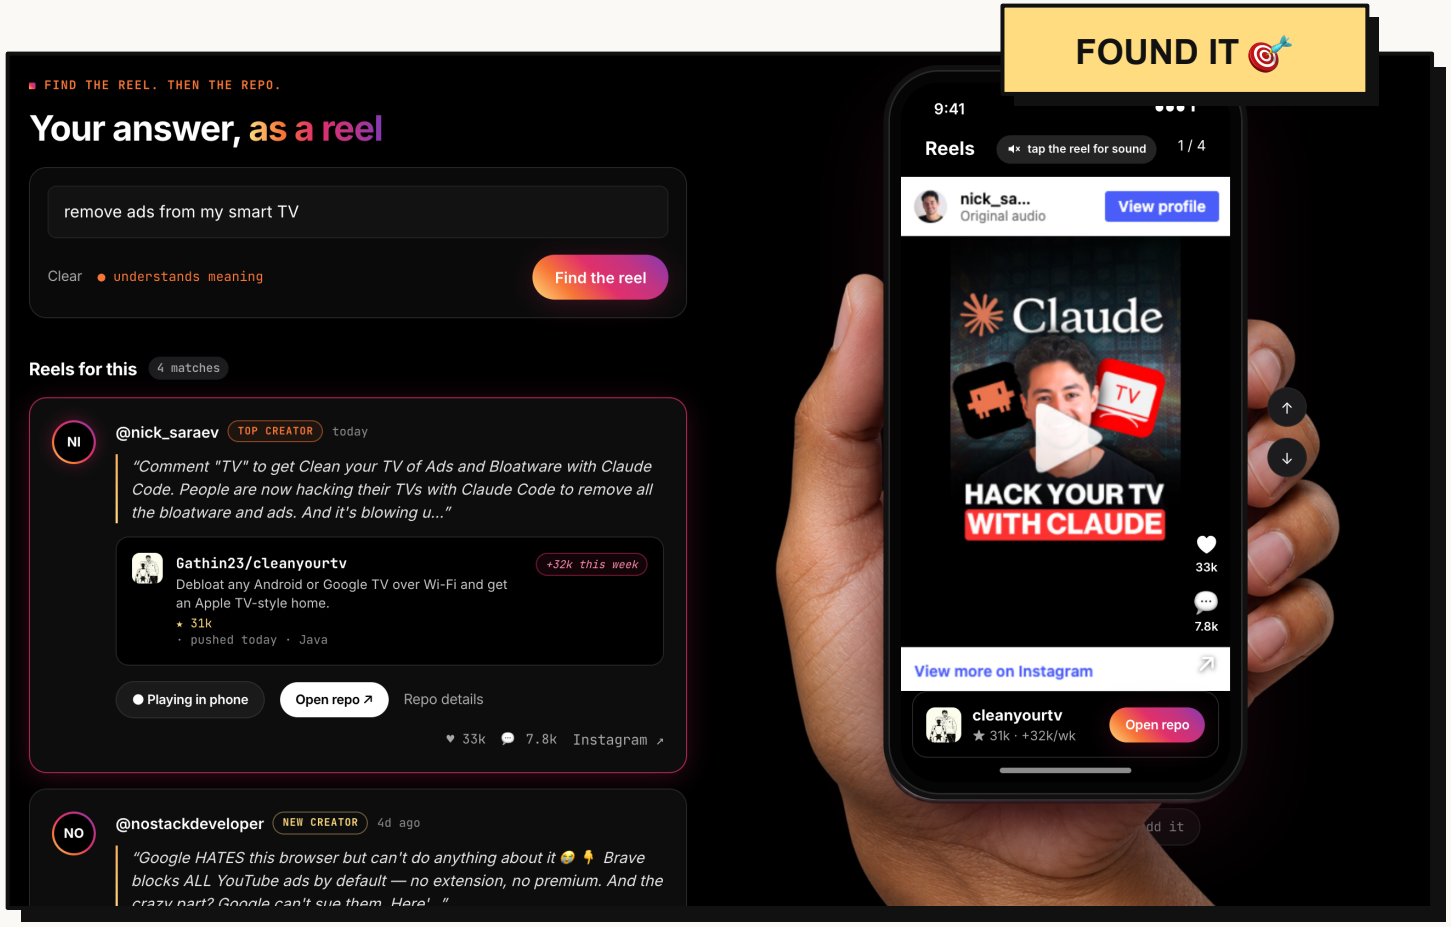

all-MiniLM-L6-v2 runs in the browser (Transformers.js), the same model the pipeline embeds with, so ranking matches offline evaluation.

Hybrid ranking

Semantic + BM25 + recency + creator trust + repo health. A reel that names its repo wins a close call: the visitor gets the link.

04

THE ANSWER IS A REEL, NOT A LIST OF LINKS

Official embeds only

The phone loads Instagram's own embed; nothing is re-hosted. Idle feeds advance, a tapped reel plays with sound.

Honest when unsure

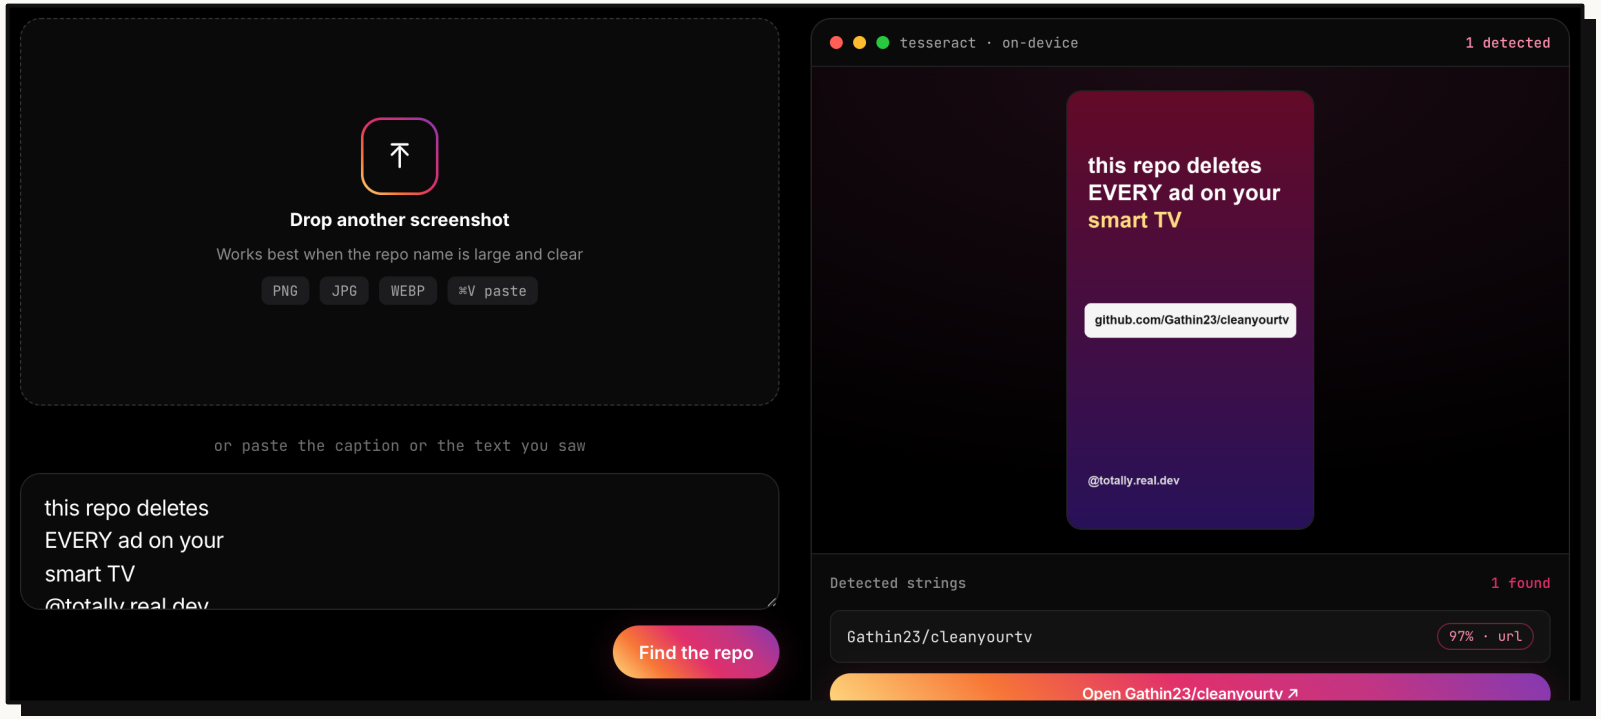

Repo not named in the caption? The card says so and offers "find matching repos" instead of guessing.

One tap to the code

"Open repo" goes straight to GitHub; "Repo details" opens README, health and similar repos.

05

SAW IT SOMEWHERE? SNAP IT.

OCR on your device

Tesseract.js reads the screenshot in the browser: upscaled, greyscaled, read as a page and as sparse text.

Exact, then fuzzy

github.com URLs and owner/name first; OCR slips matched within the same owner; GitHub search last.

97% on a test frame

A synthetic reel frame with a small URL bar resolves to the right repo.

06

A FREE PIPELINE THAT HUNTS REELS EVERY NIGHT

01 DISCOVER

Graph API (free)
Apify free credit,
budget-guarded

→

02 CLASSIFY

English caption
about a repo;
rejects remembered

→

03 EXPAND

repo creators' full
feeds + creators
they tag

→

04 MATCH

caption, cover OCR,
GitHub search;
cached per reel

→

05 PUBLISH

monthly history
shards; 256 per-
repo site shards

411

English repo reels

79

with the repo identified

4,309

repositories indexed

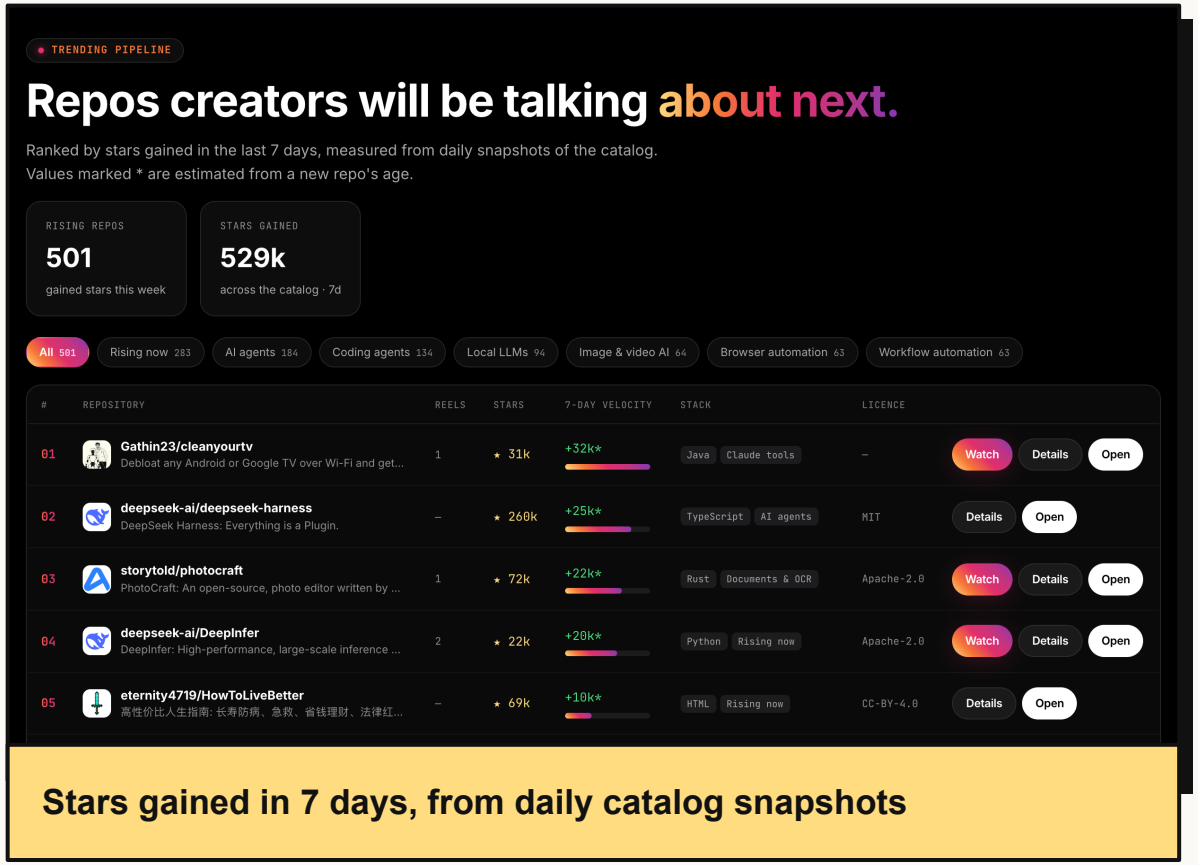

$0

infrastructure

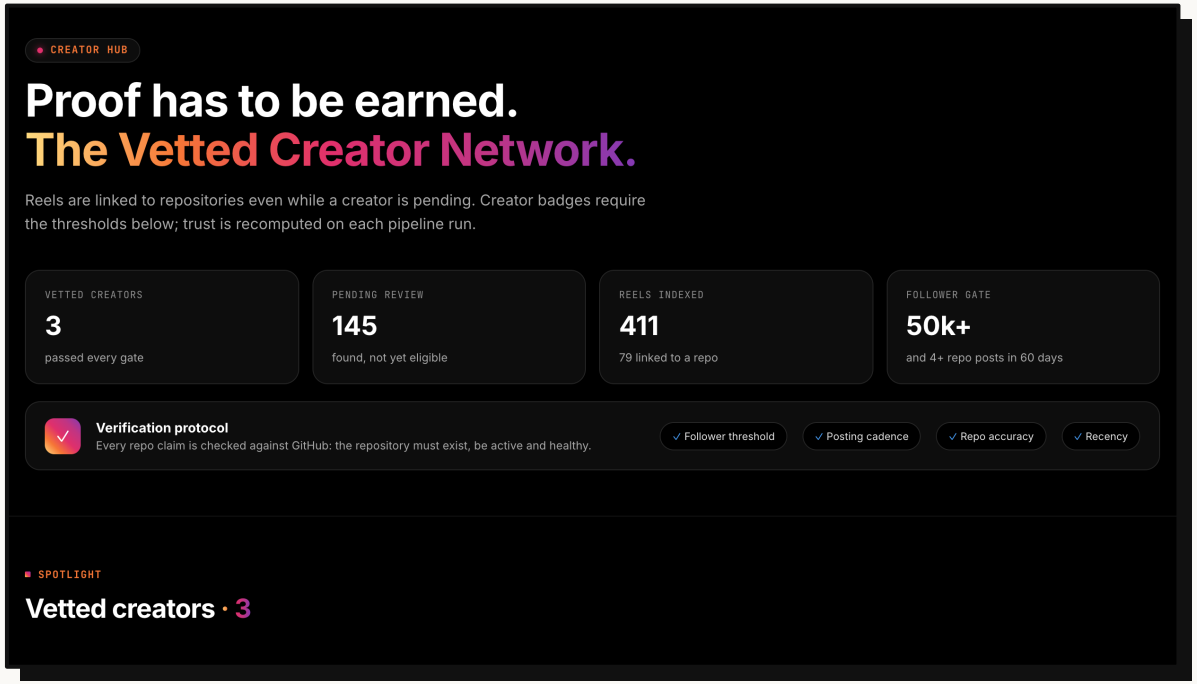

Apify spend is spread evenly over the month under a $4.50 cap; each actor run is capped at $0.25 and never retried.

07

WHAT'S ABOUT TO BLOW UP, AND WHO TO TRUST

Stars gained in 7 days, from daily catalog snapshots

Trust = accuracy · consistency · engagement · recency

08

BUILT LIKE A DATA PRODUCT

Tested

49 pipeline tests and 16 web tests run before every nightly build; tests can never touch real history.

Replayable

Replay rebuilds from recorded raw files without calling any API; resume merges into newer history.

Quality-gated

Unknown creators, orphaned repos and implausible star jumps stop a run before anything is published.

Fixed in production

A queued run rebuilt on stale data: jobs now check out the branch tip, and 411 reels were recovered without re-spending credit.
